WEB APPLICATION ASSESSMENT SOLUTION BRIEF

Digital transformation and IT innovation are booming in the last decade. New business endeavors designed as “Digitally first” are rapidly emerging. Business organizations cannot imagine their operations without WEB presence. The amount of online assets vital for sustainable performance are growing exponentially. Unsupervised, those assets are becoming easy targets for abuse by organized cyber adversaries, causing business interruptions, brand compromise and security breaches.

Organizations invest in security measures to protect their cyber assets, but threats tend to occur when they are least expected. Lack of regular testing of the cyber resilience, combined with operational negligence can lead to dangerous consequences and systems compromise. Web application assessments provide detailed information on actual, exploitable security threats and help strengthen your security controls. Such cyber exposure visibility provides the vital information required for sound digital assets protection planning.

Why SATILOR?

01

We invest in services, that help you stay on the verge of ever-changing regulations and standards for cybersecurity resilience.

02

We help solve complex challenges in alignment with business goal.

03

Our innovative approach provides resilience during corporate transformation in constantly evolving digital environment.

04
